

Steps to run the project

1. Install Kafka on the machine.
2. Run zookeeper and kafka server using the following commands:
bin/zookeeper-server-start.sh config/zookeeper.properties
bin/kafka-server-start.sh config/server.properties
3. Make a kafka topic named similar to the variable *topic* in Producer and Consumer class using the following command:
bin/kafka-topics.sh --create --zookeeper localhost:2181 --replication-factor 1 --partitions 1 --topic <variable value of *topic*>
4. Export the project to IntelliJ
5. Run the main class of producer
6. Run the main class of consumer
7. Post the messages from producer and parallel messages will be seen on consumer side
